Digital I/O board, optically isolated, 32 digital inputs and outputs, 24 V / 12 V

APCI-1500 / APCI-1500-12V
16 digital inputs, 24 V or 12 V, including 14 interruptible inputs
16 digital outputs, 10-36 V, 500 mA/channel
Optical isolation 1000 V
Input and output filters
Watchdog, timer
At Power-On the outputs are reset to "0"

Features
- 3 programmable timers
- Connector compatible to the ISA board PA 1500. Connector and software compatible to the digital I/O boards APCIe-1532 for the PCI Express bus, APCI-1532 for the PCI bus and CPCI-1500 for the CompactPCI bus.
- Monitoring program for testing and setting the board functions

Inputs
- 16 optically isolated digital inputs, 24 V or 12 V (APCI-1500-12V), including 14 interruptible inputs
- Reverse voltage protection
- All inputs are filtered

Outputs
- 16 optically isolated digital outputs, 10 V to 36 V
- Output current per channel 500 mA
- Timer programmable watchdog for resetting the outputs to "0"
- Diagnostic report through status register at short-circuits, overtemperature, voltage drop or watchdog
- Interrupt triggered through watchdog, timer, error
- At Power-On, reset of the outputs to "0"
- Short-circuit current per output ~ 3 A typ.
- Self-resetting fuse (electronic fuse)
- Overtemperature and overvoltage protection
- 24 V power outputs with protection diodes and filters
- Output capacitors against electromagnetic emissions
- External 24 V voltage supply screened and filtered
- Shutdown logic, when the external supply voltage drops below 5 V

Safety features
- Optical isolation 1000 V
- Creeping distance IEC 61010-1
- Protection against fast transients (burst), overvoltage, electrostatic discharge and high-frequency EMI
- Separate ground lines for inputs and outputs

Applications
- Industrial I/O control
- PLC coupling
- Reading of encoder values for process control
- Signal switching
- Interface to electromechanical relays
- ON/OFF monitoring of motors, lights...
- Watchdog / Timer
- Machine interfacing, ...

Software drivers
- Standard drivers for:
  - Linux Kernel from version 2.4.22, from 2.6 on request,
  - Signed 64-bit drivers for Windows Vista/XP are available
  - Monitoring program ADDIMON
  - Drivers for the following software packages:
    - LabVIEW up to 7.0 • LabWindows/CVI • DiAdem 6/7

Samples for the following compilers:
- Microsoft VC++ 5.0; Microsoft C 6.0
- Borland C++ 5.01; Borland C 3.1
- Visual Basic 1.0/4.0/5.0
- Delphi 4.0
- Turbo Pascal 7.0
- .NET on request
- LabVIEW from version 7.0 on request

On request:
- DASYLab 6/7 • Embedded NT • RTX drivers
- ADDIPACK functions:
  - Digital input with or without IRQ • Digital output

Free driver download on the web:

Demanding and safe

The ADDI-DATA APCI-1500 is a digital input/output board with 32 channels for the industrial use on PCI basis. It is protected efficiently against disturbances thanks to the optical isolation up to 1000 V. Furthermore, it is equipped with protective circuits at the inputs/outputs, as well as with interruptible inputs and watchdog function. Robust terminal panels and shielded connection cables round off the noise immunity of the APCI-1500. In this way it is suited ideally for highly demanding tasks in control and acquisition of measurement values, where the interference-free digital communication is necessary for a smooth operation.

In order to simplify the handling of the PCI board, strong software for configuration and monitoring as well as numerous drivers and programming samples are delivered freely.

Application examples

The board APCI-1500 can be used in numerous fields of the industrial automation and control.

Example 1:

The 24 V inputs/outputs are perfectly suited for the communication with other control components, e.g. stored program control (PLC).

Example 2:

The fast data transmission of bit patterns via parallel lines is used everywhere where time-critical regulation processes are involved or a lot of data is to be acquired with high sampling frequency, e.g. in test benches.

Example 3:

For the acquisition of signals and measurement values of binary single units, the whole range of binary 24-V-sensor technology is available: Light barriers, inductive proximity switches, ultrasonic sensors, mechanical switches, etc. Together with incremental encoders and time-based counter inputs, speed of rotation and angles can be determined.

Example 4:

With the outputs actuators, indicator elements, alert functions or valves are switched digitally. The outputs can supply up to 500 mA per channel at a total current of 3 A for all outputs, so that also high switching-on or starting currents cause no problems.

Example 5:

Via electromechanical relays strong consumers or contactor for motors, driving systems and pumps can be controlled.

Interference-free products – Smooth processes

Noise immunity and reliability in continuous duty belong to the most important demands of the industry. For hardware components these demands impact the electromagnetic compatibility (EMC) and a low-heat development. In harsh industrial use the electronic devices are exposed to electromagnetic interactions that can endanger the operating safety. Machine down-times and trouble shooting, especially of non-reproducible field functions, are feared by operators because they can be responsible for incalculable growing project costs and time. Therefore the APCI-1500 offers numerous protective measures in order to ensure reliable use in the industrial environment:

- Optical isolation
- Protective circuits at inputs/outputs
- Shielded voltage supply
- A creeping distance of 3.2 mm according to IEC 61010-1

In order to keep the heat development as low as possible and to dissipate power loss as thoroughly as possible, the components were selected carefully and the layout of the printed circuit card was adjusted especially to these aspects.

Customer-tailored modifications, designed to suit your needs.
Hardware and software, firmware, PLDs, ... Contact us!
**Optical isolation**

Fast transients, overvoltages and ground loops often lead to inexact measurements or to the failure of measurement equipment. Thus, all digital inputs/outputs of the APCI-1500 are isolated optically via opto-couplers. The optical isolation is a reliable method for protecting the hardware against damaging overvoltages. There is no direct connection via copper wire or semiconductor between the input and output side of the opto-coupler. For the signal transmission there is only an optical signal path with transmitter LED and light-sensitive receiver component. The opto-couplers that are used on the APCI-1500 protect the system against voltages up to 1000 V. The opto-couplers and the design of the printed circuit boards are adjusted carefully to each other. The creeping distance complies with IEC 61010-1, i.e. the shortest physical distance between the potentials is at least 3.2 mm.

**Numerous protective circuits**

Additionally, the APCI-1500 is equipped with numerous protective circuits at the inputs/outputs. Besides the optical isolation there are EMC-filters for the protection against fast transients (burst), electrostatic discharge and high-frequency emission. Furthermore, the inputs are protected against reverse voltage. The outputs are protected against short-circuits and overtemperature that protect the output drivers of the APCI-1500 against destruction and overload. The total current is limited to 3 A. If the fuse switches on, all outputs are switched off. At overload the output is pulsed automatically. The self-resetting fuse takes the outputs automatically into operation after the cause of trouble is removed. Each single output is protected against short-circuits.

**Higher computer performance through CPU relief**

Continuous cyclic request processes (polling) for standard monitoring and evaluation tasks become redundant thanks to the interruptible inputs of the APCI-1500; in this way processor and signal lines are relieved. At a change of state at the digital inputs the APCI-1500 generates always an interrupt so that the system reacts on the event via the interrupt routine and herewith fulfils the given real time criteria.

**24 V / 12 V instead of TTL**

The inputs/outputs of the APCI-1500 work with the industrial 24 V standard. Compared to the TTL level of the transistor-transistor-logic of only 5 V, the higher voltage level offers a more stable operation, even under bad conditions. Interferences that are induced into the signal lines are smaller than the wanted signal and can cause less damage, i.e. the signal-to-noise voltage ratio is bigger. In practice, this means that for example longer signal lines can be used and that the transmission near interference sources, like transformers, robots etc., is safe. The APCI-1500 interprets voltages form 0...14 V as “Low” and voltages from 19...30 V as “High”, i.e. there is no important field that is not defined.

With the APCI-1500-12V, the application range of the APCI-1500 is now extended to domains in which the use of the 12V level is widely spread such as IT, safety and alarm equipment, automotive electronics or mining.

**Setting the outputs to „0“**

In the turn-on phase, the logic components on electronic devices have different undefined intermediate states until the current supplies provide their nominal voltage. Without special measures, it cannot be determined surely, which state the output channels will take. Thus, the APCI-1500 sets all outputs after Power-On or Reset to „0“. This allows clear solutions when starting systems or measurements.

**Why watchdog function?**

Each computer system can crash because of malfunction of hardware, operating system or software. For these cases professional applications have a special “emergency solution”. For this the watchdog-timer of the APCI-1500 can monitor one or several system events that repeat cyclically within a defined time period during standard operation.

If the defined time period is exceeded or this “sign” does not occur at all, all outputs are set immediately to “0” and an interrupt is generated with the emergency routine in order to generate alerts.

In this way, systems can be brought into a safe condition or can be switched off. The integrated shut-down-logic has similar aim; it runs if the external voltage supply drops below 5 V.

**Preliminary product information**

Phone: +49 7229 1847-0   info@addi-data.com
Fax:   +49 7229 1847-222   www.addi-data.com
**Digital inputs**

Number of inputs: 16 (common ground acc. to IEC 1131-2)
Including interruptible inputs: 14, IRQ line selected through BIOS
Optical isolation: Through opto-couplers, 1000 V from PC to peripheral
Compare logic: AND or OR mode; OR priority

**24 V version (APCI-1500)**
- Nominal voltage: 24 V
- Input current at 24 V: 6 mA typ.
- Logic input levels:
  - U nominal: 24 V
  - UH max.: 30 V, current 9 mA typ.
  - UH min.: 19 V, current 2 mA typ.
  - UL max.: 14 V, current 0.7 mA typ.
  - UL min.: 0 V, current 0 mA typ.
- Signal delay: 70 µs at nominal voltage
- Maximum input frequency: 5 kHz (at nominal voltage)

**12 V version (APCI-1500-12V)**
- Nominal voltage: 12 V
- Input current at 12 V: 4 mA typ.
- Logic input levels:
  - U nominal: 12 V
  - UH max.: 6 V, current 3 mA typ.
  - UH min.: 9 V, current 2.7 mA typ.
  - UL max.: 6 V, current 1.2 mA typ.
  - UL min.: 0 V, current 0 mA typ.
- Signal delay: 70 µs at nominal voltage
- Maximum input frequency: 5 kHz (at nominal voltage)

**Digital outputs**

Number of outputs: 16, optically isolated up to 1000 V through opto-couplers
Output type: High-side (load to ground) acc. to IEC 1131-2
Nominal voltage: 24 V / 12 V (APCI-1500-12V)
Supply voltage: 10 V to 36 V, min. 5 V (via front connector)
Max. current for 16 outputs: 3 A typ.
Output current/output: 500 mA max.
Short-circuit current/output shutdown at 24 V: R_{load} < 0.1 Ω: 1.5 A
RDS ON resistance: 0.4 Ω max.
Switch-on time:
  - 1 out=0.5 A, load = resistance: 100 µs
  - 1 out=0.5 A, load = resistance: 60 µs
Switch-off time:
  - 1 out=0.5 A, load = resistance: 100 µs
  - 1 out=0.5 A, load = resistance: 60 µs
Overtemperature (shutdown): 170 °C (output driver)
Temperature hysteresis: 20 °C (output driver)

**Safety**

Shutdown logic: When the ext. 24 V voltage drops below 5 V:
The outputs are switched off.
Diagnostics: Status bit or interrupt to the PC
Timer: 3
Watchdog: Timer programmable, 10 µs to 37 s

**EMC – Electromagnetic compatibility**

The product complies with the European EMC directive. The tests were carried out by a certified EMC laboratory in accordance with the norm from the EN 61326 series (IEC 61326). The limit values as set out by the European EMC directive for an industrial environment are complied with. The respective EMC test report is available on request.

**Physical and environmental conditions**

Dimensions: 131 x 99 mm
System bus: PCI 32-bit 5 V acc. to specification 2.1 (PCISIG)
Space required: Short board, 1 PCI slot
Operating voltage: +5 V ± 5 % from the PC
Current consumption: 400 mA max. ± 10 %
Front connector: 37-pin D-Sub male connector
Temperature range: 0 to 60 °C (with forced cooling)

**Pin assignment – 37-pin D-Sub male connector**

Digital PC boards

Monitoring program ADDIMON

The APCI-1500 is configured with the monitoring program ADDIMON that is contained in the standard delivery. After the installation of the PC board the parameters can be indicated, configured and the basic functions can be tested. First field tests of the application are possible even before a specific user program is written. As there is a specific ADDIMON tool for each PC board, the board functions are supported extensively.

Universal driver software ADDIPACK

The ADDIPACK software simplifies the configuration and management of PCI boards. Until now measurement boards that were implemented in a PC, had to be managed separately. This means that when a board changed, the new boards had to be installed and configured completely new. With the ADDIPACK software you save this effort. This software bundles all ADDI-DATA boards that are installed in a computer to a single “virtual board”. As soon as the actually installed hardware is registered with the ADDIREG tool, similar functions, which are distributed over several board types, can be called up uniformly via a 32-bit ADDIDRIVER API.

The ADDEVICE Mapper manages the virtual board dynamically:

number of functions, function types, change of the virtual module and channel indexes.

New measurement boards can be added or exchanged easily. The changes of functions that were caused by this can be seen instantly. The ADDIPACK drivers are also designed for products running with new bus types such as PCI Express. More information: see page 11

The PAC system MSX-Box

Your PC alternative system for networked control, regulation and acquisition of measurement data

The APCI-1500 normally works in each standard industrial PC whose extension slots comply with the PCI specification 2.1

As a smart alternative, ADDI-DATA offers the MSX-Box, a real-time PAC system for networked control, regulation and acquisition of measurement data.

The MSX-Box is equipped with standard components like PCI backplane, PCI I/O boards, CPU, ... but has no wearing parts like hard disk, drive, keyboard, mouse, etc.

It saves space and therefore it can be integrated easily in small 19” racks or attached on DIN rail.

The MSX-Box is based on open source standards: RTAI Linux, RISC processor, web server, PCI slots for boards of any manufacturer. It exchanges measurement data with other systems via Ethernet (TCP/IP) or RS232 and has its own IP address. The self-developed CPU (MIPS 64-bit processor) was selected specifically, as well as the ADDI-DATA PCI I/O boards, in order to guarantee the long term availability and so to ensure the durability of your application. More information: see page 18.

Suitable accessories

The mechanical interface between process level and data processing is normally located in distributed switching cabinets close to the machine. ADDI-DATA offers for all PC boards suitable accessories like connection cables, pin compatible terminal panels and relay modules for mounting on DIN rails.

Also for the accessories we set the same high standards respecting operating safety and EM-compatibility as for the PC boards. Only in this way reliable data transmission and reliability of the whole system can be guaranteed.

The cables have a braid shielding, earthing on both sides and metallised hoods. The connection wires in twisted pairs match exactly the pin assignment of the APCI-1500. At the terminal panels an earthing band surrounds all sensitive components. Helpful for commissioning, trouble shooting and system diagnostics are LEDs that show the status of each digital channel. There is also the 24 V supply on the terminal panels. For the switching of big outputs up to 2500 VA there is a switching module with eight relays. Up to four relay modules are cascadable, so that 32 strong change-over contacts are available.

D-Sub connector instead of High Density (SCSI)

For the connection ADDI-DATA consequently uses industry standard D-Sub connectors, which meet the high requirements of industrial measurement and control. All outwardly connections of the APCI-1500 are realised with a 37-pin D-Sub connector. Together with optical isolation, creeping distance and further protective measures, these connectors complete the safety package of your application.
Digital PC boards

APCI-1500 / APCI-1500-12V

Digital I/O board, optically isolated, 32 digital inputs and outputs, 24 V / 12 V. Incl. technical description, software drivers and monitoring program.

**Recommended accessories for the APCI-1500**

**Example 1**
Connection of the inputs and outputs through screw terminals panel

**Example 2**
- Connection of the inputs through screw terminal panel PX901-DG
- Connection of the outputs through relay output board PX8500-G, cascade for 16 relays

**Screw terminal panel PX 901-DG**
with standard cable ST010

**Cable ST010-S**, for high currents

When you need to switch higher loads, the relay output board PX 8500-G can be connected directly to the digital outputs

**APCI-1500 / APCI-1500-12V**
